

Can I describe the functions of the different parts of a plant?

Fast Five: Can you label the different parts of this plant?

Fast Five: Can you label the different parts of this plant?

Each different part of the plant does a different job

Roots: The roots of the plant keep the plant in the ground. They also absorb water and nutrients from the soil.

Stem: The stem (or trunk, if we're talking about a tree) holds the plant up and transports the nutrients from the soil to the leaves.

Leaves: The leaves make food for the plant by absorbing sunlight and carbon dioxide from the air.

Flower: The flower produces the seeds that will grow into new plants. They are brightly coloured so that they can attract pollinators such as bees.

Your Task

Can you match the functions to the part of the plant?

See the sheet for challenges.
